This isn't the first book I have read that covers Unix file systems. All the standard Unix implementation (e.g., Bach (SVR2), McKusick et al (BSD)) and OS design books (e.g, Tanenbaum (Minux)) have something to say about file system design.

System design is the phase that bridges the gap between problem domain and the existing system in a manageable way. This phase focuses on the solution domain, i.e. "how to implement?" It is the phase where the SRS document is converted into a format that can be implemented and decides how the system will operate.

The system described shows an order of magnitude increase in performance over traditional log systems; it is of particular interest to system administrators of UNIX-based systems. As indicated in the abstract, "the log-structured file system writes modifications to disk sequentially in a log-like structure, thereby speeding up both file writing and crash recovery.

IFSCQ combines and extends work on cryptographic file systems and formally certified file systems to prove that our design is correct. It is the first certified file system that is secure against strong adversaries that can maliciously corrupt on-disk data and metadata, including attempting to roll back the disk to earlier versions of valid data.
