Here is our finite element idealization, once again. And the next step now is to read in also the coordinates of all the elements and the temperatures at the nodal points. Now with this coordinate system, x , y , and z , as shown here, the coordinate of all of these nodal points can be read indirectly.

Using the beam idealization, engineers can analyze and design cold-formed steel portal frames, including making appropriate allowances for connection effects, without the need to resort to expensive finite element shell analysis. AB - A simple linear beam idealization of a cold-formed steel portal frame is presented in which beam elements are used to idealize the column and rafter members, and rotational spring elements are used to represent the rotational flexibility of the joints.
