Physical Introduction: Wells ...

We live at the bottom of an invisible ocean called the atmosphere, a layer of gases surrounding our planet. Nitrogen and oxygen account for 99 percent of the gases in dry air, with argon, carbon dioxide, helium, neon, and other gases making up minute portions. Water vapor and dust are also part of Earth 's

ocean to warm the overlying atmosphere, it creates air temperature gradients and, consequently, winds.

Ocean and Climate Fact Sheet - NASA

The ocean and atmosphere are connected. They work together to move heat and fresh water across the globe.

Read Book The Atmosphere And Ocean A Physical Introduction

Wind-driven and ocean-current circulations move warm water toward the poles and colder water toward the equator. The ocean can store much more heat than the land surfaces on the Earth.

Energy in the Ocean and Atmosphere

Read Book The Atmosphere And Ocean A Physical Introduction

The deep ocean below the thermocline has its own circulation patterns driven by the density of the water, which is dependent on temperature and salinity (thermohaline circulation). Vertical motions through and below the thermocline allow heat to be stored in the deep ocean and released back into contact with the atmosphere.

tropical waters around the equator, where the ocean acts like a massive, heat-retaining solar panel. Land areas also absorb some sunlight, and the atmosphere helps to retain heat that would otherwise quickly radiate into space after sunset.

How does the ocean affect climate

Read Book The Atmosphere And Ocean A Physical Introduction

and weather on land ...

The ocean has become more acidic over the past few decades because of increased levels of atmospheric carbon dioxide, which dissolves in the water. Higher acidity affects the balance of minerals in the water, which can make it more difficult for certain marine animals to build their protective skeletons or

Read Book The Atmosphere And Ocean A Physical Introduction

Over 96% of total global water is in the ocean, so let's start there. Energy from the sun causes water on the surface to evaporate into water vapor - a gas. This invisible vapor rises into the atmosphere, where the air is colder, and condenses into clouds. Air currents move these clouds all around the earth.

Read Book The Atmosphere And Ocean A Physical Introduction

To understand the effects of winds on ocean currents, one first needs to understand the Coriolis force and the Ekman spiral. If the Earth did not rotate and remained stationary, the atmosphere would circulate between the poles (high pressure areas) and the equator (a low pressure area) in a simple back-and-forth pattern.
